

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

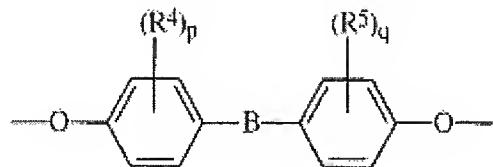

**Listing of Claims:**

1. (currently amended) A method of producing a copolycarbonate with improved color wherein the method comprises the steps of,

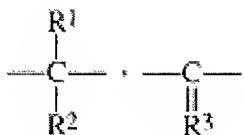

i. preparing a molten reaction mixture in a monomer mix tank wherein the reaction mixture comprises comprising a first dihydroxy aromatic compound comprising monomer residue (a), a second dihydroxy aromatic compound comprising monomer residue (b), and a carbonate source,

wherein monomer residue (a) is a quinone structure, or a structure capable of forming a quinone structure upon oxidation,

wherein monomer residue (b) is a quinone structure, or a structure capable of forming a quinone structure upon oxidation different from monomer residue (a) or is,

where B is

-O-, -CO-, -S-, -SO<sub>2</sub>-, a C<sub>6</sub> - C<sub>20</sub> aromatic radical, or a C<sub>6</sub> - C<sub>20</sub> cycloaliphatic radical; the groups R<sup>1</sup> and R<sup>2</sup> are independently a hydrogen atom, C<sub>1</sub> - C<sub>20</sub> alkyl radical, C<sub>4</sub> - C<sub>20</sub> cycloalkyl radical, or C<sub>4</sub> - C<sub>20</sub> aryl radical; or R<sup>1</sup> and R<sup>2</sup> together form a C<sub>4</sub> - C<sub>20</sub> cycloaliphatic ring which is optionally substituted by one or more C<sub>1</sub> - C<sub>20</sub> alkyl, C<sub>6</sub> - C<sub>20</sub> aryl, C<sub>5</sub> - C<sub>21</sub> aralkyl, C<sub>5</sub> - C<sub>20</sub> cycloalkyl groups or a combination thereof, R<sup>3</sup> is a divalent hydrocarbylene group, and R<sup>4</sup> and R<sup>5</sup> are independently a hydrogen atom, halogen atom, nitro group, cyano group, C<sub>1</sub> - C<sub>20</sub> alkyl radical C<sub>4</sub> - C<sub>20</sub> cycloalkyl radical, or C<sub>6</sub> - C<sub>20</sub> aryl radical and p and q are both integers from 0 to 4,

ii. selecting a catalyst introduction strategy sufficient to result in a product copolycarbonate with improved color, wherein the catalyst introduction strategy is selected from the group consisting of;

1. introducing a polymerization catalyst to the molten reaction mixture after monomer residues (a), monomer residues (b), and carbonate source are melted and prior to substantial polymerization;

ii. 2. introducing a polymerization catalyst to the reaction mixture or monomer residues prior to melting in said monomer mix tank with the proviso that the residence time of the process from the start of melting until substantial polymerization has occurred is less than 4 hours, and

3. or a combination thereof;

wherein the polymerization catalyst is an inorganic catalyst, an organic catalyst, or both an inorganic catalyst and an organic catalyst which may be introduced separately or together,

iii. introducing the catalyst according to the selected catalyst introduction strategy,

iv. ~~iii.~~ introducing the reaction mixture to a series of process units, wherein said series of process units comprises, ~~in sequence, a monomer mix tank and~~ a plurality of polymerization process units in which polymerization occurs and copolymer molecular weight increases, and

v. ~~iv.~~ allowing the reaction mixture to polymerize in the series of process units thereby forming copolycarbonate, wherein the copolycarbonate has improved color as compared to a copolycarbonate formed in a melt process wherein said residence time is not less than 4 hours, ~~without the steps of selecting a catalyst introduction strategy and introducing catalyst according to the selected strategy~~.

2. - 18. (canceled)

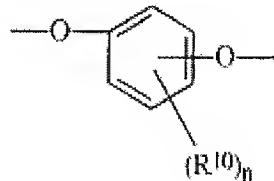

19. (Currently amended) The method of claim 1, wherein the polymerization catalyst comprises an organic catalyst and an inorganic catalysts and is both are introduced to the reaction mixture or monomer residues prior to melting with the proviso that the residence time of the process from the start of melting until substantial polymerization has occurred is less than 4 hours.

20. (original) The method of claim 19, wherein the residence time of the process from the start of melting until substantial polymerization has occurred is 30 minutes or less.

21. (original) The method of claim 20, wherein the residence time of the process from the start of melting until substantial polymerization has occurred is 15 minutes or less minutes.

22. (original) The method of claim 19, wherein the inorganic catalyst is NaOH and the organic catalyst is selected from the group consisting of TMAH, TBPA, and combinations thereof.

23. (original) The method of claim 19, wherein monomer residue (a) has the structure,

where each R<sup>10</sup> is independently at each occurrence a hydrogen atom, halogen atom, nitro group, cyano group, C<sub>1</sub> - C<sub>20</sub> alkyl, C<sub>4</sub> - C<sub>20</sub> cycloalkyl radical, C<sub>4</sub> - C<sub>20</sub> aryl radical, and n is an integer from 0 to 4.

24. (original) The method of claim 19, wherein monomer residue (a) is catechol, resorcinol, hydroquinone, butyl hydroquinone, methyl hydroquinone or any combination thereof.

25. (original) The method of claim 19, wherein monomer residue (b) is BPA.

26. (original) The method of claim 19, wherein the carbonate source is diphenyl carbonate.

27. (original) The method of claim 19, wherein the carbonate source is an activated carbonate and is bismethylsalicylcarbonate.

28. (original) The method of claim 19, wherein up to 50 mole% of the precursor of the carbonate source is derived from the group consisting of dicarboxylic acids, dicarboxylic acid esters, dicarboxylic acid halide or any combination thereof.

29. (original) The method of claim 19, wherein the inorganic and organic catalysts are introduced

together or separately.

30. (currently amended) The method of claim 19 50, wherein the inorganic and organic catalysts are introduced to the a monomer mix tank or a melter together with monomer residue (a), together with monomer residue (b), together with the carbonate source, in a separate feed or combinations thereof.

31. (currently amended) The method of claim 1, wherein the polymerization catalyst comprises organic and inorganic catalysts,

wherein the organic catalyst is introduced to the reaction mixture or monomer residues prior to melting with the proviso that the residence time of the process from the start of melting until substantial polymerization has occurred is less than 4 hours, and

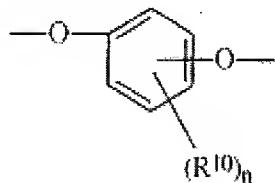

wherein the inorganic catalyst is introduced to the reaction mixture after monomer residues (a), monomer residues (b), and carbonate source are melted, and wherein the introduction occurs prior to substantial polymerization.

32. (original) The method of claim 31, wherein the residence time of the process from the start of melting until substantial polymerization has occurred is 30 minutes or less.

33. (original) The method of claim 32, wherein the residence time of the process from the start of melting until substantial polymerization has occurred is 15 minutes or less.

34. (original) The method of claim 31, wherein the inorganic catalyst is NaOH and the organic catalyst is selected from the group consisting of TMAH, TBPA, and combinations thereof.

35. (original) The method of claim 31, wherein monomer residue (a) has the structure,

where each  $R^{10}$  is independently at each occurrence a hydrogen atom, halogen atom, nitro group, cyano group,  $C_1 - C_{20}$  alkyl,  $C_4 - C_{20}$  cycloalkyl radical,  $C_4 - C_{20}$  aryl radical, and  $n$  is an integer from 0 to 4.

36. (original) The method of claim 35, wherein monomer residue (a) is catechol, resorcinol, hydroquinone, butyl hydroquinone, methyl hydroquinone or any combination thereof.

37. (original) The method of claim 31, wherein monomer residue (b) is BPA.

38. (original) The method of claim 31, wherein the carbonate source is diphenyl carbonate.

39. (original) The method of claim 31, wherein the carbonate source is an activated carbonate and is bismethylsalicylcarbonate.

40. (original) The method of claim 31, wherein up to 50 mole% of the precursor of the carbonate source is derived from the group consisting of dicarboxylic acids, dicarboxylic acid esters, dicarboxylic acid halide or any combination thereof.

41. (previously presented) The method of claim 31, wherein the organic catalyst is introduced to the monomer mix tank or a melter together with monomer residue (a), together with monomer residue (b), together with the carbonate source, in a separate feed or combinations thereof, and wherein the inorganic catalyst is introduced to the molten reaction mixture, within the

monomer mix tank, a feed line from the monomer mix tank to a first process unit of the plurality of polymerization process units, the first process unit, a feed line to a second process unit of the plurality of polymerization process units, the second process unit, a feed line to a third process unit of the plurality of polymerization process units, the third process unit, or combinations thereof.

42. (original) The method of claim 1, wherein the copolymer has a molecular weight Mw of at least 10,000 g/mole (Polystyrene standards) and the molecular weight Mw is subsequently increased to a value higher than 25,000 g/mole (Polystyrene standards) using a standard extrusion step.

43. (original) The method of claim 1, wherein the copolymer has a molecular weight Mw of at least 10,000 g/mole (Polystyrene standards) and the molecular weight Mw is subsequently increased to a value higher than 25,000 g/mole (Polystyrene standards) by further reaction of oligomers by means of solid state polymerization.

44 - 45. (canceled)
